Using an ultrasonic scaler

An ultrasonic scaler

An ultrasonic scaler consists of a wand with a small scaling tip that produces a soft ultrasonic vibration and a gentle flow of water. As the tip moves along the tooth surface, it makes quick, small vibrations that break up plaque and tartar.

These vibrations give you a tickling sensation and cause millions of microscopic bubbles to form in the water.

The benefits of ultrasonic scaling

Ultrasonic scaling can be more comfortable than hand scaling because the tip is extremely small. Also, much of the work is done without disturbing the gum tissue.

In addition, we can add a medicated solution to the water to treat any infection and aid healing.

Scaling your teeth with an ultrasonic scaler is an effective and efficient method for helping you keep your healthy and beautiful smile.
